## ABSTRACT

The principles of invariance form the foundation of the study of irradiance fields in the sea. By review of the existing theory, it is shown how these principles may be applied to imbedded layers to derive complete reflectance and transmittance factors for the containing layer. These complete factors in turn yield the desired irradiance fields. They are also used to develop local invariance principles and the associated local transmittance and reflectance factors. Differential equations for reflectance and transmittance are developed, based on these local factors, and in turn are used in numerical computations of the reflectance and transmittance factors for arbitrarily deep layers of water. Boundary conditions on the upper and lower surfaces of the layer are chosen so that the complete reflectance and the complete transmittance factors generate the irradiances of the appropriate light field. Numerical computations are based on real data for eight natural media. To study the dependence of the light field on extreme cases of the optical properties, two hypothetical cases are also considered.

# LIST OF SYMBOLS

$X(x,z)$	Slab of water with boundary surfaces at $x$ and $z$ .
$H(z,\pm)$	Irradiances of upward (+) flux/downward (-) flux.
$D(z,\pm)$	Distribution functions of the light field.
$a$	Volume absorption coefficient.
$b$	Backward scattering coefficient.
$a(\pm)$	Volume absorption coefficient for (+)/(-) stream.
$b(\pm)$	Backward scattering coefficient for (+)/(-) stream.
$\alpha$	Volume attenuation coefficient.
$s$	Volume total scattering coefficient.
$\rho$	Scattering-attenuation ratio ( $= s/\alpha$ ).
$T(x,y)$	Standard transmittance of the (-) stream in $X(x,z)$ .
$R(x,z)$	Standard reflectance of the (-) stream in $X(x,z)$ .
$T(z,x)$	Standard transmittance of the (+) stream in $X(x,z)$ .
$R(z,x)$	Standard reflectance of the (+) stream in $X(x,z)$ .
$\mathcal{R}(x,y,z)$	Complete reflectance at depth $y$ for a slab of depth $(z-x)$ .
$\mathcal{T}(x,y,z)$	Complete transmittance at depth $y$ for a slab of depth $(z-x)$ .
$\rho(z,\pm)$	Local reflectance factors for (+)/(-) stream.
$\tau(z,\pm)$	Local transmittance factors for (+)/(-) stream.
IR	Interreflectance.
$T(o,d)$	Truncated transmittance.
TR	Truncated reflectance: $T(o,d) \cdot R(d,o)$ .
————	Solid line on figures corresponds to normal light field, $D(+)=8/3$ , $D(-)=4/3$ .
-----	Dashed line corresponds to collimated light field; $D(+)=D(-)=1$ .

#### ACKNOWLEDGEMENT

I wish to express my gratitude to Professor R. W. Preisendorfer without whose guidance and encouragement this paper would not have been possible.

## I. INTRODUCTION

Radiative transfer problems in a natural optical medium can be solved by means of appropriate models presented in Ref. 1. These models utilize the concepts of irradiance, or radiant flux per unit area on a surface, and therefore use a single value rather than the infinite set of numbers required by the radiance distribution. The geometric structure of atmospheric or oceanic light fields is such that the variations of these fields over great distance within horizontal planes is negligible, so that the irradiance value at one point of a horizontal plane is the same as at other remote points of the plane. As a result of this very slight variation the light field over a plane may be characterized by a single irradiance common to all points of the plane. Consequently, the flow of radiant energy into the sea or the atmosphere is reduced under these conditions to the irradiance flow along a straight line normal to the horizontal planes of that region of the sea or air under consideration.

The model used in this study of optical media was based on this straight-line flow in which the flow itself was broken into two parts, a downward flow and an upward flow.

Eight real optical media are considered. Computations are based on measured optical data, and comparisons are made between the various computed irradiances as a function of depth, and the variations of the parameters in the two-flow model. The

computations were based on measured absorption and scattering parameters which in turn were derived from samples of distilled water, Pacific Coastal and off-shore water, and water from Lake Pend Oreille, Idaho. These measurements were made by Tyler [Ref. 2] and the coefficients for attenuation, total scattering, absorption and backward scattering were taken from his results. Two additional media studied were purely hypothetical which covered parameter ranges not ordinarily found in lakes or the sea. The purpose of studying these hypothetical media was to ascertain the dependences of the reflectance and transmittance factors on depth and lighting geometry in highly scattering media.

## II. PHYSICAL SETTING

The media were considered to be plane-parallel slabs  $X(a,b)$  which were free from internal sources so that the radiative properties depended only on depth  $z$  within  $X(a,b)$ ,  $a \leq z \leq b$ . Depth was measured from  $z=0$  at the surface downward to a final depth arbitrarily chosen to be fifteen optical depths for this study, where an optical depth corresponds to the inverse of the attenuation coefficient,  $\alpha$ . Direction is indicated by (+) for upward and (-) for downward flow.

Irradiance is the concept of area density of radiant flux and is defined as follows. Let  $S$  be a flat, horizontal surface at a depth,  $z$ , which is connected to a meter which reads the

amount of monochromatic radiant energy striking the surface per unit time. Irradiance is defined as the quotient of this power reading by the collecting surface area and hence has dimension power per area, which may be represented in units of watts per square meter. In this context,  $H(z,+)$  is the irradiance of upward flux on S at a depth, z, and  $H(z,-)$  is the irradiance of downward flux at the same depth.

### III. DISTRIBUTION FUNCTIONS

Irradiance at a depth z can be measured in a second manner. Consider a spherical surface with a surrounding barrier which allows the radiant energy to flow in only from the upper or lower directional hemisphere, depending upon whether the allowed flow is in the downward or upward direction. Irradiance is then the radiant flux per unit surface area of sphere and is denoted " $h(z,-)$ " for downward and " $h(z,+)$ " for upward flow.

The distribution functions are defined to be the ratio of these two irradiances:

$$D(z,\pm) = \frac{h(z,\pm)}{H(z,\pm)} .$$

Some examples will clarify the concept.

Example 1.

Consider a beam of energy of cross-section area A, power P, striking a flat surface at an angle  $\theta$  from the area's normal. Then the area on the surface receiving radiant energy is  $A \sec \theta$ . Then:

$$H(\theta) = \frac{P}{A \sec \theta} = \frac{P}{A} \cos \theta = H \cos \theta$$

and  $D = h/H = \sec \theta$ . Hence  $D = 1$  for normal incidence, and  $D$  increases as the angle of incidence becomes more oblique.

Example 2.

If we consider energy incident in equal amounts over all angles from a hemisphere onto the collecting surface then we find that

$$D = h/H = 2.$$

In general, it has been experimentally discovered that the values  $D(+)$  and  $D(-)$  differ by a factor of two, and in fact have approximate values of  $D(-) = 4/3$  and  $D(+) = 8/3$  for the green wavelength in most natural waters. Note also that the sum is consequently approximately four. It has been found that even though these values may vary slightly, their sum remains essentially the same.

These D-factors from the basis of the two-D theory as developed in Ref. 3. Using these distribution factors, the volume absorption functions and backward scattering functions for the upward and downward streams are obtained by:

$$a(z, \pm) = D(\pm) a(z)$$

$$b(z, \pm) = D(\pm) b(z).$$

The first of these is exact. The second in an approximation to the exact expression for  $b(z, \pm)$  for the purposes of this study. For full definitions, see Ref. 1.

#### IV. PRINCIPLES OF INVARIANCE

There are two basic "axioms" of the subject of irradiance and these are the principles of invariance developed in Ref.

1. Specialized for invariance they are:

$$H(y,+) = H(z,+)T(z,y) + H(y,-)R(y,z) \quad (1)$$

$$H(y,-) = H(x,-)T(x,y) + H(y,+)R(y,x) \quad (2)$$

where  $a \leq x \leq y \leq z \leq b$ . The numbers  $T(x,y)$ ,  $R(y,x)$ ,  $T(z,y)$  and  $R(y,z)$  are the transmittances (T) and reflectances (R) of the pieces  $X(x,y)$  and  $X(y,z)$  of the slab  $X(a,b)$ .

Note that  $T(x,x) = 1$  and  $R(x,x) = 0$ .

##### A. INVARIANT IMBEDDING RELATION

Using (1) and (2) it is possible to derive the invariant imbedding relations for the slab  $X(a,b)$ . That is, knowing the value of  $H(a,-)$  and  $H(b,+)$  which comprise the irradiance sources of the slab, how can the intermediate values  $H(y,-)$  and  $H(y,+)$  be calculated? Application of the invariance principles (1) and (2) to a subslab  $X(x,z)$ , (by letting  $a = x$ ,  $b = z$ ) yields two new equations dependent only on the known irradiance sources:

$$H(y,+) = H(z,+) \mathfrak{T}(z,y,x) + H(x,-) \mathcal{R}(x,y,z) \quad (3)$$

$$H(y,-) = H(x,-) \mathfrak{T}(x,y,z) + H(z,+) \mathcal{R}(z,y,x) \quad (4)$$

where:

$$\mathcal{R}(x,y,z) = \frac{T(x,y)R(y,z)}{1-R(y,x)R(y,z)} \quad (5)$$

$$\mathfrak{T}(x,y,z) = \frac{T(x,y)}{1-R(y,x)R(y,z)} \quad (6)$$

$$\mathcal{R}(z, y, x) = \frac{T(z, y) R(y, x)}{1 - R(y, x) R(y, z)} \quad (7)$$

$$\mathcal{T}(z, y, x) = \frac{T(z, y)}{1 - R(y, x) R(y, z)} \quad (8)$$

The operators  $\mathcal{R}, \mathcal{T}$  defined in (5) - (8) are the complete reflectance and complete transmittance factors. Note the following special results for all  $x$  and  $y$ :

$$\mathcal{R}(x, x, y) = R(x, y)$$

$$\mathcal{T}(x, y, y) = T(x, y)$$

$$\mathcal{R}(x, y, y) = 0$$

$$\mathcal{T}(x, x, y) = 1.$$

These statements are obtained directly from (5), (6) upon proper substitutions. A complementary set may be obtained from (7), (8).

The imbedding relations (3), (4) provide the general form of the solution to the radiative transfer problem in the slab  $X(a, b)$ . Knowing the  $\mathcal{R}$  and  $\mathcal{T}$  factors for every level of a subslab  $X(a, y)$  in  $X(a, b)$  will yield the irradiance field  $H(y, +)$ ,  $H(y, -)$  at that level  $y$  in  $X(a, b)$ . The complete reflectance and transmittance operators are dependent on the standard operators  $R$  and  $T$ . Consequently, knowing either the value of  $R$  and  $T$ , or the  $\mathcal{R}$  and  $\mathcal{T}$  factors, all questions about  $H(y, \pm)$  can be answered.

## V. LOCAL PRINCIPLES OF INVARIANCE

Isolation of the subslab  $X(x, z)$  of  $X(a, b)$  and formation of the difference quotient:

$$\frac{H(z, \pm) - H(x, \pm)}{z - x} \quad (9)$$

and observing the associated limit as  $x$  approaches  $z$ , results in a reduction of the irradiance field to a completely local description in terms of the change of the irradiance field at a depth  $z$ .

Consider the downward field. Setting  $y = z$  in (2) yields:

$$H(z, -) = H(x, -)T(x, z) + H(z, +)R(z, x)$$

The difference quotient (9) applied to this representation of  $H(z, -)$  gives:

$$\frac{H(z, -) - H(x, -)}{z - x} = H(x, -) \frac{[T(x, z) - 1]}{z - x} + H(z, +) \frac{R(z, x)}{z - x} \quad (10)$$

As  $z - x$  approaches zero and the slab becomes increasingly thinner, its reflectance approaches zero and its transmittance approaches one yielding the possibility of well-defined limits for the quotients on the right side of (10).

Therefore the following definitions are made:

$$\tau(z, -) = \lim_{x \rightarrow z} \frac{T(x, z) - 1}{z - x} \quad (11)$$

$$\rho(z, +) = \lim_{x \rightarrow z} \frac{R(z, x)}{z - x} \quad (12)$$

$$\frac{dH(z, -)}{dz} = \lim_{x \rightarrow z} \frac{H(z, -) - H(x, -)}{z - x} \quad (13)$$

These definitions give rise to the differential equation for  $H(z, -)$ :

$$\frac{dH(z, -)}{dz} = H(x, -)\tau(z, -) + H(z, +)\rho(z, +) \quad (14)$$

This is the governing equation for the downward irradiance field  $H(z, -)$ . Similarly, setting  $y=z$  in (1) and applying a second difference quotient we have:

$$-\frac{H(x, +) - H(z, +)}{x - z} = H(z, +) \frac{[T(z, x) - 1]}{z - x} + H(x, -) \frac{R(x, z)}{z - x} \quad (15)$$

The definitions:

$$\tau(z, +) = \lim_{x \rightarrow z} \frac{T(z, x) - 1}{z - x} \quad (16)$$

$$\rho(z, -) = \lim_{x \rightarrow z} \frac{R(x, z)}{z - x} \quad (17)$$

$$\frac{dH(z, +)}{dz} = \lim_{x \rightarrow z} \frac{H(x, +) - H(z, +)}{z - x} \quad (18)$$

yields the governing equation for the upward irradiance field  $H(z, +)$ :

$$-\frac{dH(z, +)}{dz} = H(z, +)\tau(z, +) + H(x, -)\rho(z, -) \quad (19)$$

Equations (14) and (19) are the local forms of the principles of invariance and  $\tau(z, \pm)$  and  $\rho(z, \pm)$  are the local transmittance and local reflectance factors for upward (+) and downward (-) irradiance. These factors are defined in Ref. 3 as:

$$\tau(z, \pm) = -[a(z, \pm) + b(z, \pm)] \quad (20)$$

$$\rho(z, \pm) = b(z, \pm) \quad (21)$$

The assumptions of the two-D theory require the independence of  $z$  of  $D(z, \pm)$  and the independence of the local transmittance and reflectance factors of depth, so that the "z" may be omitted from  $\tau(z, \pm)$  and  $\rho(z, \pm)$ .

## VI. DIFFERENTIAL EQUATIONS FOR THE STANDARD REFLECTANCE AND TRANSMITTANCE FACTORS

Derivation of the differential equations of the R and T factors are based on the local and global forms of the principles of invariance. Stated again, the global forms are:

$$\begin{aligned} \text{I.} \quad H(y,+) &= H(z,+)T(z,y) + H(y,-)R(y,z) \\ \text{II.} \quad H(y,-) &= H(x,-)T(x,y) + H(y,+)R(y,x) \end{aligned}$$

Following the general procedure in Ref. 1, consider a slab  $X(a,b)$  with a subslab  $X(x,z)$  where  $a \leq x \leq y \leq z \leq b$ . Assume that  $H(a,-)$  is known and  $H(b,+)$  is zero.

Let  $z = b$  in I and differentiate with respect to  $y$ . The boundary conditions give the resulting equation:

$$\frac{dH(y,+)}{dy} = \frac{dH(y,-)}{dy} R(y,b) + H(y,-) \frac{dR(y,b)}{dy}$$

Let  $y$  approach  $a$ , the upper boundary and define:

$$\frac{\partial R(a,b)}{\partial a} = \lim_{y \rightarrow a} \frac{dR(y,b)}{dy}$$

By (14) and (19) we then have:

$$\begin{aligned} &-H(a,+) \tau(+) - H(a,-) \rho(-) \\ &= [H(a,-) \tau(-) + H(a,+) \rho(+)] R(a,b) + H(a,-) \frac{\partial R(a,b)}{\partial a} \end{aligned}$$

Application of I for  $y = a$  gives:

$$\begin{aligned} &-H(a,-) R(a,b) \tau(+) - H(a,-) \rho(-) \\ &= [H(a,-) \tau(-) + H(a,-) R(a,b) \rho(+)] R(a,b) + H(a,-) \frac{\partial R(a,b)}{\partial a} \end{aligned}$$

This equation holds for every value of  $H(a, -)$ , which can therefore be formally cancelled giving the differential operator:

$$- \frac{\partial R(a, b)}{\partial a} = \rho(-) + \tau(-) R(a, b) + R(a, b) \tau(+) + R(a, b) \tau(+) R(a, b) \quad (22)$$

Setting  $x = a$  in II and differentiating gives:

$$\frac{dH(y, -)}{dy} = H(a, -) \frac{dT(a, y)}{dy} + \frac{dH(y, +)}{dy} R(y, a) + H(y, +) \frac{dR(y, a)}{dy}$$

Let  $y$  approach  $b$ ; then by (14) and (19) we have:

$$H(b, -) \tau(-) = H(a, -) \frac{\partial T(a, b)}{\partial b} - H(b, -) \rho(-) R(b, a)$$

Application of II for  $y = b$ ,  $x = a$  gives:

$$H(a, -) T(a, b) \tau(-) = H(a, -) \frac{\partial T(a, b)}{\partial b} - H(a, -) T(a, b) \rho(-) R(b, a)$$

Formal cancellation of  $H(a, -)$  then yields:

$$\frac{\partial T(a, b)}{\partial b} = T(a, b) \tau(-) + T(a, b) \rho(-) R(b, a) \quad (23)$$

The principles of invariance I and II can also be written as:

$$I' \quad H(x, +) = H(z, +) T(z, x) + H(x, -) R(x, z)$$

$$II' \quad H(z, -) = H(x, -) T(x, z) + H(z, +) R(z, x)$$

In II' set  $z = b$  and differentiate with respect to  $x$ .

The boundary conditions then give:

$$0 = \frac{dH(x, -)}{dx} T(x, b) + H(x, -) \frac{dT(x, b)}{dx}$$

Let  $x$  approach  $a$  and apply (14) and (19).

$$0 = [H(a, -) \tau(-) + H(a, +) \rho(+)] T(a, b) + H(a, -) \frac{\partial T(a, b)}{\partial a}$$

Application of I' for  $x = a$  and  $z = b$  gives:

$$0 = [H(a,-)\tau(-)+H(a,-)R(a,b)\rho(+)]T(a,b) + H(a,-)\frac{\partial T(a,b)}{\partial a}$$

Formal cancellation of  $H(a,-)$  gives the third differential operator:

$$-\frac{\partial T(a,b)}{\partial a} = \tau(-)T(a,b) + R(a,b)\rho(+T(a,b) \quad (24)$$

Finally, in  $I'$  set  $x = a$  and differentiate with respect to  $z$  obtaining:

$$0 = \frac{dH(z,+)}{dz} T(z,a) + H(a,-)\frac{dR(a,z)}{dz}$$

Let  $z$  approach  $b$  and apply (14) and (19) yielding:

$$0 = -H(b,-)\rho(-)T(b,a) + H(a,-)\frac{\partial R(a,b)}{\partial b}$$

Application of  $II'$  for  $x = a, z = b$  gives:

$$0 = -H(a,-)T(a,b)\rho(-)T(b,a) + H(a,-)\frac{\partial R(a,b)}{\partial b}$$

Formal cancellation of  $H(a,-)$  gives the final differential operator:

$$\frac{\partial R(a,b)}{\partial b} = T(a,b)\rho(-)T(b,a) \quad (25)$$

Reference 1 shows that for the homogeneous medium where  $\rho$  and  $\tau$  are independent of depth and  $D(+) = D(-)$  that  $T(a,b) = T(b,a)$  and that  $R(a,b) = R(b,a)$ .

In general, the terms in (22) - (25) do not commute, in particular if computation is done in matrix form or integral operator form. However if the operations are done individually for scalar value fields such as H-fields, then the commutative law holds and (22) - (25) may be rewritten as:

$$-\frac{\partial R(a,b)}{\partial a} = \rho(-) + [\tau(-) + \tau(+)]R(a,b) + \rho(+R^2(a,b) \quad (26)$$

$$\frac{\partial T(a,b)}{\partial b} = [\tau(-) + \rho(-) R(b,a)] T(a,b) \quad (27)$$

$$- \frac{\partial T(a,b)}{\partial a} = [\tau(-) + \rho(+) R(a,b)] T(a,b) \quad (28)$$

$$\frac{\partial R(a,b)}{\partial b} = \rho(-) T(a,b) T(b,a) \quad (29)$$

Corresponding differential operators for  $R(b,a)$  and  $T(b,a)$  are obtained in the same manner. Their form is the same with a corresponding change of sign in the  $\rho$  and  $\tau$  terms as shown here for comparison.

$$- \frac{\partial R(b,a)}{\partial b} = \rho(+) + [\tau(+) + \tau(-)] R(b,a) + \rho(-) R^2(b,a) \quad (26')$$

$$\frac{\partial T(b,a)}{\partial b} = [\tau(+) + \rho(+) R(a,b)] T(b,a) \quad (27')$$

$$- \frac{\partial T(b,a)}{\partial a} = [\tau(+) + \rho(-) R(b,a)] T(b,a) \quad (28')$$

$$\frac{\partial R(a,b)}{\partial b} = \rho(+) T(b,a) T(a,b) \quad (29')$$

The differential operators expressed in equations (26), (28), (26') and (28') were the operators used to begin calculation of the data presented in later sections.

## VII. CONCLUSIONS

Figures and tables giving the numerical results from which these conclusions are drawn are appended below.

For every medium the reflectances  $R(o,d)$  and  $R(d,o)$  reached an asymptote at a very early stage ranging from two to six optical depths and 95% of this value was reached in one to three optical depths for normal lighting conditions.

That is, the full reflectance of a deep slab is already reached in the first several meters. For normally collimated incident light, the depth of asymptoticity is slightly greater but the pattern is the same. As would be expected, all other factors the same, the more murky or cloudy (i.e., the greater the scattering-attenuation ratio  $\rho$ ) the water, the greater the reflectance of a deep slab. Note also that the unequal values of the distribution functions  $D(+)$  and  $D(-)$  caused a difference in  $R(o,d)$  and  $R(d,o)$ . THIS DIFFERENCE WAS A FACTOR OF TWO; PRECISELY THAT OF THE DIFFERENCE OF THE DISTRIBUTION FUNCTIONS. IN GENERAL, THEN ONE WOULD EXPECT  $R(o,d)$  AND  $R(d,o)$  TO BE SENSITIVE TO THE DIRECTIONAL DISTRIBUTION OF THE INCIDENT LIGHT. THIS IS PERHAPS THE PRINCIPAL CONCLUSION THAT MAY BE DRAWN FROM THE NUMERICAL STUDY OF THE TWO-D MODEL AND SERVES AS A MATHEMATICAL JUSTIFICATION OF THE MODEL.

The eight natural media (this excludes the hypothetical cases) all indicated on exponential decay in the transmittances  $T(o,d)$  and  $T(d,o)$ . Comparisons of the semi-log slopes of these decays were approximately equal to the volume absorption function multiplied by the appropriate distribution function. THUS, TRANSMITTANCE LOSSES ARE PRIMARILY DUE TO ABSORPTION RATHER THAN BACKSCATTER. Although not exactly a straight line, the hypothetical cases gave approximately the same result which shows the wide range of applicability of the above assertion. THIS STRAIGHT-LINE BEHAVIOR IS THE SECOND

PRINCIPAL CONCLUSION OF THE THEORY, AND ALLOWS GREAT SIMPLIFICATIONS TO BE MADE IN PRACTICAL USE OF THE THEORY BY EXPERIMENTERS.

Note that for all cases  $T(d,o)$  is less than  $T(o,d)$ , i.e., transmittance upward is less than transmittance downward. This is expected since  $a(+) > a(-)$  in the general case which, in turn, reflects the assumption  $D(+) > D(-)$ . For collimated light, where  $a(+) = a(-)$  and  $b(+) = b(-)$ , the two transmittances are equal as were their reflectances  $R(o,d)$  and  $R(d,o)$ . This bears out numerically the polarity theorem in Ref. 1.

In all cases except the last hypothetical media, it is noted that  $T(o,d)$  for the normal incidence lighting condition was less than that for the collimated light field. Observe however that as the waters become more milky ( $\rho$  greater)  $T(o,d)$  increases and this end result, after some thought, is not surprising. It is also noted that as the distribution functions for collimated light are successively increased,  $D(\underline{+}) = 1, 2, 3$ , the transmittance  $T(o,d)$  decreased.

The interreflectance term,  $[1/(1-R(o,d)R(d,o))]$ , of the complete reflectance and complete transmittance factors  $\mathcal{R}(o,d,15)$  and  $\mathcal{T}(o,d,15)$  was very nearly unity with the exception of the last extreme hypothetical case. For this reason the complete reflectance  $\mathcal{R}$  and complete transmittance  $\mathcal{T}$  were very nearly  $T(o,d) \cdot R(d,o)$  and  $T(o,d)$ , respectively. These quantities are called truncated reflectance and truncated

transmittance respectively. These truncated quantities are equal to their complete counterparts at zero and fifteen optical depths which correspond to the boundary surfaces of the layer. They were less than their complete counterparts at intermediate depths, but only slightly so. HENCE FOR ALL PRACTICAL PURPOSES, ONE COULD REPLACE THE  $\mathcal{R}$  AND  $\mathcal{T}$  FACTORS BY THEIR TRUNCATED COUNTERPARTS. THIS IS THE THIRD MAIN CONCLUSION OF THIS STUDY, AND AGAIN THIS PROVIDES A MATERIAL SIMPLIFICATION IN THE PRACTICAL DETERMINATION OF LIGHT FIELDS IN NATURAL WATERS.

Note that the interreflectance term is symmetric about the slab center, rising sharply at the boundary layers and reaching a plateau in about two optical depths, the exception being the last hypothetical media in which the rise was more gradual in a highly scattering material ( $\rho$  large). For collimated light the interreflectance is slightly larger and the plateau is reached later. In general one would expect  $R$  to reach a plateau later, the larger  $\rho$  is.

The numerical data presented here are based on the conditions  $H(0,-) = 1$  and  $H(15,+) = 0$ . By the linearity of (3) and (4) the tabulated values of  $\mathcal{R}$  and  $\mathcal{T}$  may be used to represent  $H(y,\pm)$  for given  $H(0,-)$  and  $H(d,+)$ , taking care that the  $\mathcal{R}$  and  $\mathcal{T}$  for the appropriate D-factors are used. Observe that the Figures are numbered similarly to the Tables. Thus, Figure 1-A is the plot from Tables 1-A and 1-B and the medium's optical properties appear at the head of each table.

Computer printout required the change of notation  $A=a$ ,  
 $B=b$ ,  $A(\pm)=a(\pm)$ ,  $B(\pm)=b(\pm)$ ,  $S=s$ ,  $ALPHA=\alpha$ ,  $RHO=\rho$ . All  
optical constants are measured generally in the green wave-  
length: 480 mμ. For further details, consult Ref. 2.

# ROUTINE FOR RKLDEQ

## PURPOSE:

THIS ROUTINE SOLVES A SYSTEM OF N FIRST-ORDER ORDINARY DIFFERENTIAL EQUATIONS BY THE RUNGE-KUTTA-GILL FOURTH-ORDER METHOD. ALL CALCULATIONS ARE DOUBLE-PRECISION.

## USAGE: (WHEN USED BY A FORTRAN CALLING PROGRAM)

S = RKLDEQ (N,Y,F,X,H,NT)

FOUR ENTRIES ARE REQUIRED TO ADVANCE THE SOLUTION FROM X TO X+H WHERE H IS THE INCREMENT.

## DESCRIPTION OF PARAMETERS:

N - NUMBER OF FIRST-ORDER EQUATIONS IN SYSTEM TO BE SOLVED.

Y - NAME OF LINEAR ARRAY OF LENGTH AT LEAST N, IN WHICH SOLUTION VALUES WILL BE STORED BY RKLDEQ. THE CALLING PROGRAM SHOULD SUPPLY INITIAL VALUES BEFORE FIRST ENTRY.

F - NAME OF LINEAR ARRAY OF LENGTH AT LEAST N, IN WHICH THE DERIVATIVES, COMPUTED BY USER'S CALLING PROGRAM, ARE STORED.

X - THE INDEPENDENT VARIABLE, WHICH IS ADVANCED WITHIN RKLDEQ.

H - THE INCREMENT FOR X, WHICH MAY BE CHANGED AT THE END OF ANY INTERVAL. (WHEN S=2.0)

NT - AN INTEGER WHICH COUNTS THE NUMBER OF TIMES ENTRY TO RKLDEQ HAS BEEN MADE DURING THE CURRENT INTERVAL. IT MUST BE INITIALLY SET TO ZERO BY USER BEFORE FIRST CALL OF RKLDEQ. SUBSEQUENTLY IT SHOULD NOT BE CHANGED BY THE USER.

S - A SWITCH TO BE TESTED BY USER UPON RETURN FROM RKLDEQ.

IF S=1.0, THE CALLING PROGRAM SHOULD NOW COMPUTE VALUES OF F, USING CURRENT VALUES OF X AND Y, AND RETURN TO RKLDEQ.

IF S=2.0, AND END OF PRESENT INTERVAL HAS BEEN REACHED, USER SHOULD STORE AND/OR OUTPUT CURRENT X AND/OR Y AND TEST FOR END OF COMPUTATION.

## REMARKS:

Y,F,X, AND H ARE DOUBLE PRECISION (REAL\*8), RKLDEQ IS REAL\*4. MAXIMUM N IS 25.

```

13. ABSTRACT  The principles of invariance form the foundation of the study of irradiance fields in the sea. By review of the existing theory, it is shown how these principles may be applied to imbedded layers to derive complete reflectance and transmittance factors for the containing layer. These complete factors in turn yield the desired irradiance fields. They are also used to develop local invariance principles and the associated local transmittance and reflectance factors. Differential equations for reflectance and transmittance are developed, based on these local factors, and in turn are used in numerical computations of the reflectance and transmittance factors for arbitrarily deep layers of water. Boundary conditions on the upper and lower surfaces of the layer are chosen so that the complete reflectance and the complete transmittance factors generate the irradiances of the appropriate light field. Numerical computations are based on real data for eight natural media. To study the dependence of the light field on extreme cases of the optical properties, two hypothetical cases are also considered.
